

The MM-FI *Posting* Cheat Sheet

What SAP posts in accounting when goods and invoices move, in four pages. Built from SAP Help, SAP Best Practices and SAP Learning, with every number worked through.

THE THREE TRANSACTION KEYS YOU MEET FIRST

BSX

Inventory posting: all postings to stock accounts, determined by the material's valuation class.

WRX

GR/IR clearing: the offsetting entry of a goods receipt for a purchase order, cleared by the invoice.

PRD

Price differences: where variances go for standard-price materials (and part of some MAP cases).

Your actual G/L accounts come from your own automatic account determination (transaction OBYC, "Configure Automatic Postings"). The numbers in this guide are illustrative unless marked "SAP's example".

Scope: PO items without account assignment (stock material), no taxes, no delivery costs, single currency. The posting logic is the same in SAP ECC; ACDOCA (page 4) applies to SAP S/4HANA.

Goods *arrive*: movement type 101

A valuated goods receipt for a purchase order creates two documents: a **material document** (the stock moved) and an **accounting document**, called a journal entry in S/4HANA (the value moved).

Example: PO for 100 PC at a net price of 10.00 EUR. GR before invoice: GR value = quantity received × net order price.

MOVING AVERAGE PRICE (V)

Account	Debit	Credit
Inventory BSX	1,000.00	
GR/IR WRX		1,000.00

Stock takes quantity × PO price; the moving average price adjusts.

STANDARD PRICE (S) = 9.00

Account	Debit	Credit
Inventory BSX	900.00	
Price diff. PRD	100.00	
GR/IR WRX		1,000.00

Stock at standard price; the difference to the PO price goes to PRD. Material price unchanged.

Not the supplier At goods receipt there is no invoice yet, so the supplier (vendor) account is not touched. The supplier liability is posted at invoice receipt. GR/IR holds the value in between.

Price control in one line

Set in the material master (Accounting 1 view): **S** keeps a fixed standard price and sends variances to price-difference accounts; **V** lets the moving average price follow receipts and invoices. SAP recommends V for raw materials and trading goods and S for semifinished and finished products.

The invoice *clears* GR/IR

At invoice receipt, GR/IR is cleared on the basis of the **PO price**, and the supplier is credited with the **invoice price**.

INVOICE AT 10.50 INSTEAD OF 10.00 (100 PC)

Account	Debit	Credit
GR/IR clearing	1,000.00	
Stock (V, enough stock) or price differences (S)	50.00	
Supplier		1,050.00

For V: if part of the goods was already withdrawn, only the quantity still in stock absorbs the variance; the rest goes to price differences.

Credit

GR/IR credit balance = goods **received**, not yet invoiced.

Debit

GR/IR debit balance = goods **invoiced**, not yet received.

Invoice *before* goods receipt

The GR is then valued at the **invoice price** for the invoiced quantity, and at the **PO price** for the rest.

SAP'S EXAMPLE

PO: 100 PC at $10 · Invoice first: 50 PC at $12 = $600 · Goods receipt: 70 PC

GR value = 50 × $12 + 20 × $10 = $800 (not 70 × $10 = $700)

With GR-based invoice verification on the PO item, SAP proposes no invoice items until a goods receipt exists.

Leftover GR/IR *balances*

Quantity differences can leave balances on the GR/IR account. If no further goods receipt or invoice is expected for the PO item, clear them with **GR/IR account maintenance**:

- Transaction **MR11** (Maintain GR/IR Clearing Account) or the Fiori app **Clear GR/IR Clearing Account**; MR11SHOW displays or cancels the maintenance document.
- **Reconcile GR/IR Accounts** (F3302) builds worklists of PO items with differences; **Monitor GR/IR Account Reconciliation** (F3303) gives KPIs.
- Account maintenance is for **quantity** differences. Price differences are settled when the invoice is posted.

Where it *lands* in S/4HANA

The line items of the journal entry land in **ACDOCA**, the Universal Journal: one line-item table for General Ledger, Asset Accounting, Controlling, margin analysis and the Material Ledger. FI and CO share the same line items, so no FI-CO reconciliation is required.

Not everything moved: BKPF still holds the document header; BSEG still stores the source documents (entry view) and open-item data. The material document is stored in MATDOC instead of MKPF/MSEG.

Your 5-second checklist

- GR posted? Dr stock (BSX) / Cr GR/IR (WRX), plus PRD for standard price.
- Invoice posted? Dr GR/IR at PO price / Cr supplier at invoice price; variance to stock or PRD.
- GR/IR not zero? Credit = received not invoiced; debit = invoiced not received.
- Leftover quantities and no more GR/IR expected? Account maintenance.
